Abstract. The aim of this paper is to give some combinatorial relations linked polynomials generalizing those of Appell type to the partial r -Bell polynomials. We give an inverse relation, recurrence relations involving some family of polynomials and their exact expressions at rational values in terms of the partial r -Bell polynomials. We illustrate the obtained results by various comprehensive examples.

Keywords. The partial r -Bell polynomials; polynomials of Appell type; inverse relations; recurrence relations.

Mathematics Subject Classification 2010: 05A18; 12E10; 11B68.

1 Introduction

This work is motivated by the work of Mihoubi and Tiachachat [15] on the expressions of the Bernoulli polynomials at rational numbers by the Whitney numbers and the work of Mihoubi and Saidi [14] on the polynomials of Appell type.

The aim of this paper is to give some combinatorial relations linked polynomials generalizing those of Appell type to the partial r -Bell polynomials. For given two sequences of real numbers $\mathbf{a} = (a_1, a_2, \dots)$ and $\mathbf{b} = (b_1, b_2, \dots)$, recall that the partial r -Bell polynomials

$$B_{n,k}^{(r)}(\mathbf{a}; \mathbf{b}) := B_{n,k}^{(r)}((a_j); (b_j)) = B_{n,k}^{(r)}(a_1, a_2, \dots; b_1, b_2, \dots)$$

are defined by their generating function to be

$$\sum_{n \geq k} B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) \frac{t^n}{n!} = \frac{1}{k!} \left(\sum_{j \geq 1} a_j \frac{t^j}{j!} \right)^k \left(\sum_{j \geq 0} b_{j+1} \frac{t^j}{j!} \right)^r.$$

These polynomials present a naturel extension of the partial Bell polynomials [1] and generalize the r -Whitney numbers of both kinds, the r -Lah numbers and the r -Whitney-Lah numbers. Mihoubi et Rahmani [12] introduced and studied these polynomials for which they gave combinatorial and probabilistic interpretations and several properties. Shattuck [19] gave more properties and Chouria and Luque [4] defined three versions of the partial r -Bell polynomials in three combinatorial Hopf algebras. For an application of these polynomials on a family of bivariate polynomials, let us define this family. Indeed, let A , B and H be three analytic functions around zero with $A(0) = 0$, $A'(0) = B(0) = 1$ and let α and x be real numbers. A sequence of numbers $P_n^{(\alpha)}(A, H)$ is defined by

$$\sum_{n \geq 0} P_n^{(\alpha)}(A, H) \frac{t^n}{n!} = \left(\frac{t}{A(t)} \right)^\alpha H(t) \quad (1)$$

and a sequence of polynomials $P_n^{(\alpha)}(x, y \mid A, B, H)$ is to be

$$\sum_{n \geq 0} P_n^{(\alpha)}(x, y \mid A, B, H) \frac{t^n}{n!} = \left(\frac{t}{A(t)} \right)^\alpha (A'(t))^x (B(t))^y H(t). \quad (2)$$

In the second section we give an inverse relation linked to the partial r -Bell polynomials and in the third section we give recurrence relations and exact expressions at rational values for the bivariate polynomials defined above.

2 The partial r -Bell polynomials and inverse relations

For any power series $A(t) = \sum_{j \geq 1} a_j \frac{t^j}{j!}$ with $a_1 \neq 0$, below, we denote by $\bar{A}(t) = \sum_{j \geq 1} \bar{a}_j \frac{t^j}{j!}$ for the compositional inverse of $A(t)$ and we let $\mathbf{a} := (a_1, a_2, \dots)$ and $\bar{\mathbf{a}} := (\bar{a}_1, \bar{a}_2, \dots)$.

The following theorem gives inverse relations linked to the partial r -Bell polynomials.

Theorem 1 *The following inverse relations hold*

$$U_n = \sum_{k=0}^n B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) V_k, \quad V_n = \sum_{k=0}^n B_{n+r, k+r}^{(r)}(\bar{\mathbf{a}}; (\mathbf{b} \circ \bar{\mathbf{a}})^{-1}) U_k,$$

i.e.

$$\sum_{k=j}^n B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) B_{k+r, j+r}^{(r)}(\bar{\mathbf{a}}; (\mathbf{b} \circ \bar{\mathbf{a}})^{-1}) = \delta_{(j, n)},$$

where $\mathbf{b} \circ \bar{\mathbf{a}}$ is the sequence of the coefficients of the power series $B(\bar{A}(t))$ and $(\mathbf{b} \circ \bar{\mathbf{a}})^{-1}$ is the sequence of the coefficients of the power series $(B(\bar{A}(t)))^{-1}$.

Proof. If $U(t) = \sum_{n \geq 0} U_n \frac{t^n}{n!}$ and $V(t) = \sum_{n \geq 0} V_n \frac{t^n}{n!}$, then $U(t) = V(A(t))(B(t))^r$, or equivalently, by replacing t by $\bar{A}(t)$, it becomes $V(t) = U(\bar{A}(t))(B(\bar{A}(t)))^{-r}$. \square

Example 1 For $A(t) = \frac{\exp(mt)-1}{m}$ and $B(t) = \exp(t)$ we get

$$\begin{aligned} \bar{A}(t) &= \frac{\ln(1+mt)}{m}, \\ (B(\bar{A}(t)))^{-1} &= (1+mt)^{-\frac{1}{m}}, \\ B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) &= W_{m, r}(n, k), \\ B_{n+r, k+r}^{(r)}(\bar{\mathbf{a}}; (\mathbf{b} \circ \bar{\mathbf{a}})^{-1}) &= w_{m, r}(n, k). \end{aligned}$$

So, we obtain the inverse relations

$$U_n = \sum_{k=0}^n W_{m, r}(n, k) V_k, \quad V_n = \sum_{k=0}^n w_{m, r}(n, k) U_k,$$

where $w_{m, r}(n, k)$ and $W_{m, r}(n, k)$ are, respectively, the whitney numbers of the first and second kind, for more information, see for example [2, 7, 8, 9, 12, 17].

For $B(t) = A'(t)$ in Theorem 1 we obtain:

Corollary 2 *The following inverse relations hold*

$$U_n = \sum_{k=0}^n B_{n+r,k+r}^{(r)}(\mathbf{a}) V_k, \quad V_n = \sum_{k=0}^n B_{n+r,k+r}^{(r)}(\bar{\mathbf{a}}) U_k,$$

where $B_{n+r,k+r}^{(r)}(\mathbf{a}) := B_{n+r,k+r}^{(r)}(\mathbf{a}; \mathbf{a})$.

For $A(t) = (1-t)^\beta - 1$ and $B(t) = (1-t)^\alpha$ in Theorem 1 we obtain:

Corollary 3 *Let α, β be two real numbers such that $\beta \neq 0$. Then, the following inverse relations hold*

$$\begin{aligned} U_n &= \sum_{k=0}^n B_{n+r,k+r}^{(r)}((\beta)_j; (\alpha)_{j-1}) V_k, \\ V_n &= \sum_{k=0}^n (-1)^{n-k} B_{n+r,k+r}^{(r)}((-1/\beta)_j; \langle \alpha/\beta \rangle_{j-1}) U_k, \end{aligned}$$

where $(\alpha)_n := \alpha(\alpha-1)\cdots(\alpha-n+1)$ if $n \geq 1$, $(\alpha)_0 := 1$ and $\langle \alpha \rangle_n := (-1)^n (-\alpha)_n$.

For $B(t) = A(t) + 1$ in Theorem 1 we obtain:

Corollary 4 *Then, the following inverse relations hold*

$$\begin{aligned} U_n &= \sum_{k=0}^n B_{n+r,k+r}^{(r)}((a_j); (a_{j-1})) V_k, \quad a_0 = 1, \\ V_n &= \sum_{k=0}^n B_{n+r,k+r}^{(r)}((\bar{a}_j); ((-1)^{j-1} (j-1)!)) U_k. \end{aligned}$$

3 Recurrence relations involving the polynomials $P_n^{(\alpha)}$

In [14] we are proved the following identity

$$P_n^{(\alpha)}(A, H) = P_n^{(n+1-\alpha)}\left(B, (A' \circ B)^{-1}(H \circ B)\right), \quad (3)$$

from which we gave

$$P_n^{(n+1+\alpha)}(A, H) = \sum_{k=0}^n B_{n,k}(\bar{\mathbf{a}}) P_k^{(\alpha)}\left(A, (A')^{-1} H\right),$$

and, in particular, if we let $\left(\frac{t}{A(t)}\right)^\alpha (A'(t))^x = \sum_{n \geq 0} T_n^{(\alpha)}(x | A) \frac{t^n}{n!}$, we get

$$T_n^{(n+1+\alpha)}(x+1 | A) = \sum_{k=0}^n B_{n,k}(\bar{\mathbf{a}}) T_k^{(\alpha)}(x | A).$$

The following theorem generalizes this last identity as follows:

Theorem 5 *There holds*

$$P_n^{(\alpha)}(x, y \mid A, B, H) = \sum_{k=0}^n B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) P_k^{(k+1+\alpha)}(x+1, y-r \mid A, B, H), \quad (4)$$

or equivalently

$$P_n^{(n+1+\alpha)}(x, y \mid A, B, H) = \sum_{k=0}^n B_{n+r, k+r}^{(r)}(\bar{\mathbf{a}}; (\mathbf{b} \circ \bar{\mathbf{a}})^{-1}) P_k^{(\alpha)}(x-1, y+r \mid A, B, H). \quad (5)$$

Proof. We prove that the two sides of (5) have the same exponential generating functions. Indeed,

$$\begin{aligned} & \sum_{n \geq 0} \left(\sum_{k=0}^n B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) P_k^{(k+1+\alpha)}(x, y \mid A, B, H) \right) \frac{t^n}{n!} \\ &= \sum_{k \geq 0} P_k^{(k+1+\alpha)}(x, y \mid A, B, H) \left(\sum_{n \geq k} B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) \frac{t^n}{n!} \right) \\ &= \sum_{k \geq 0} P_k^{(k+1+\alpha)}(x, y \mid A, B, H) \frac{(A(t))^k}{k!} (B(t))^r \end{aligned}$$

and, by identity (3), the following identity

$$\begin{aligned} P_k^{(k+1+\alpha)}(x, y \mid A, B, H) &= D_{t=0}^k \left[\left(\frac{t}{A(t)} \right)^{k+1+\alpha} (A'(t))^x (B(t))^y H(t) \right] \\ &= D_{t=0}^k \left[\left(\frac{t}{\bar{A}(t)} \right)^{-\alpha} (A' \circ \bar{A}(t))^{x-1} (B \circ \bar{A}(t))^y (H \circ \bar{A}(t)) \right] \\ &= D_{t=0}^k \left[\left(\frac{t}{\bar{A}(t)} \right)^{-\alpha} (\bar{A}'(t))^{1-x} (B \circ \bar{A}(t))^y (H \circ \bar{A}(t)) \right] \\ &= P_k^{(-\alpha)}(1-x, y \mid \bar{A}, B \circ \bar{A}, H \circ \bar{A}), \end{aligned}$$

shows that the last expansion becomes

$$\begin{aligned} & \sum_{k \geq 0} P_k^{(-\alpha)}(1-x, y \mid \bar{A}, B \circ \bar{A}, H \circ \bar{A}) \frac{(A(t))^k}{k!} (B(t))^r \\ &= \left(\frac{A(t)}{\bar{A}(A(t))} \right)^{-\alpha} (\bar{A}'(A(t)))^{1-x} (B(\bar{A}(A(t))))^y H(\bar{A}(A(t))) (B(t))^r \\ &= \left(\frac{t}{A(t)} \right)^{\alpha} (A(t))^{x-1} (B(t))^{y+r} H(t) \\ &= \sum_{n \geq 0} P_n^{(\alpha)}(x-1, y+r \mid A, B, H) \frac{t^n}{n!}. \end{aligned}$$

The first identity of this theorem can be obtained from the second one by apply Theorem 1. \square

Let $(L_n^{(\alpha, \beta)}(x); n \geq 0)$ be a sequence of polynomials defined by

$$\sum_{n \geq 0} L_n^{(\alpha, \beta)}(x) t^n = (1-t)^\alpha \exp \left(x \left((1-t)^\beta - 1 \right) \right).$$

Then, the application of Theorem 5 to the sequence $(L_n^{(\alpha, \beta)}(x); n \geq 0)$ gives:

Corollary 6 *There holds*

$$L_n^{(\alpha, \beta)}(x+y) = \sum_{k=0}^n (-1)^k L_{n-k}^{(k, \beta)}(x) \left(L_k^{(-\alpha-2, -\beta)}(y) - 2k L_{k-1}^{(-\alpha-3, -\beta)}(y) \right).$$

Proof. For $A(t) = t - t^2$, $B(t) = \exp\left((1-t)^\beta - 1\right)$ and $H(t) = 1$ we get

$$\begin{aligned} \sum_{n \geq 0} B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) \frac{t^n}{n!} &= \frac{t^k}{k!} (1-t)^k \exp\left(r \left((1-t)^\beta - 1\right)\right) \\ &= \frac{1}{k!} \sum_{n \geq k} L_{n-k}^{(k, \beta)}(r) t^n, \\ \sum_{n \geq 0} P_n^{(-\alpha)}(1, y \mid A, B, 1) \frac{t^n}{n!} &= \left(\frac{t}{t-t^2}\right)^{-\alpha} (1-2t) \exp\left(y \left((1-t)^\beta - 1\right)\right) \\ &= \sum_{n \geq 0} \left(L_n^{(\alpha, \beta)}(y) - 2n L_{n-1}^{(\alpha, \beta)}(y) \right) t^n, \\ \sum_{n \geq 0} P_n^{(-\alpha)}(0, y \mid A, B, 1) \frac{t^n}{n!} &= \sum_{n \geq 0} L_n^{(\alpha, \beta)}(y) t^n. \end{aligned}$$

So, we get

$$\begin{aligned} B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) &= \frac{n!}{k!} L_{n-k}^{(k, \beta)}(r), \\ P_n^{(-\alpha)}(1, y \mid A, B, 1) &= n! \left(L_n^{(\alpha, \beta)}(y) - 2n L_{n-1}^{(\alpha, \beta)}(y) \right), \\ P_n^{(-\alpha)}(0, y \mid A, B, 1) &= n! L_n^{(\alpha, \beta)}(y). \end{aligned}$$

Then, from (4) we get

$$L_n^{(\alpha, \beta)}(y) = \sum_{k=0}^n L_{n-k}^{(k, \beta)}(r) \left(L_k^{(k+1+\alpha, \beta)}(y-r) - 2k L_{k-1}^{(k+1+\alpha, \beta)}(y-r) \right)$$

and by the identity $L_n^{(\alpha, \beta)}(x) = (-1)^n L_n^{(n-1-\alpha, -\beta)}(x)$ [13] we get

$$L_n^{(\alpha, \beta)}(r+y) = \sum_{k=0}^n (-1)^k L_{n-k}^{(k, \beta)}(r) \left(L_k^{(-\alpha-2, -\beta)}(y) - 2k L_{k-1}^{(-\alpha-3, -\beta)}(y) \right).$$

Now, since the polynomial

$$Q_n(x) = L_n^{(\alpha, \beta)}(x+y) - \sum_{k=0}^n (-1)^k L_{n-k}^{(k, \beta)}(x) \left(L_k^{(-\alpha-2, -\beta)}(y) - 2k L_{k-1}^{(-\alpha-3, -\beta)}(y) \right)$$

vanishes on each non-negative integer r , the desired identity follows. \square

Recall that the high order Bernoulli polynomials of the first kind $\left(B_n^{(\alpha)}(x)\right)$ are defined by

$$\sum_{n \geq 0} B_n^{(\alpha)}(x) \frac{t^n}{n!} = \left(\frac{t}{\exp(t) - 1} \right)^\alpha \exp(xt)$$

with $B_n^{(1)}(x) = B_n(x)$ is the n -th Bernoulli polynomials of the first kind, see [6, 16, 18, 20].

Corollary 7 *There hold*

$$B_n^{(\alpha)}(x) = \sum_{k=0}^n \frac{W_{m,r}(n, k)}{m^{n-k}} B_k^{(k+1+\alpha)} \left(x + 1 - \frac{r}{m} \right), \quad (6)$$

$$B_n^{(n+1+\alpha)}(x) = \sum_{k=0}^n \frac{w_{m,r}(n, k)}{m^{n-k}} B_k^{(\alpha)} \left(x - 1 + \frac{r}{m} \right) \quad (7)$$

and

$$\begin{aligned} B_n^{(n+p+1)} \left(1 - \frac{r}{m} \right) &= \frac{1}{m^n} \binom{n+p}{p}^{-1} w_{m,r}(n+p, p), \\ B_n^{(p)} \left(\frac{r-s}{m} \right) &= \frac{1}{m^n} \sum_{k=0}^n \binom{k+p}{p}^{-1} W_{m,r}(n, k) w_{m,s}(k+p, p). \end{aligned}$$

Proof. For $A(t) = \frac{1}{m} (\exp(mt) - 1)$, $B(t) = \exp(t)$ and $H(t) = 1$ we get

$$\begin{aligned} \bar{A}(t) &= \frac{1}{m} \ln(1 + mt), \\ (B(\bar{A}(t)))^{-1} &= (1 + mt)^{-\frac{1}{m}}, \\ B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) &= W_{m,r}(n, k), \\ B_{n+r, k+r}^{(r)}(\bar{\mathbf{a}}; (\mathbf{b} \circ \bar{\mathbf{a}})^{-1}) &= w_{m,r}(n, k), \\ P_n^{(\alpha)}(x, y \mid A, B, 1) &= m^n B_n^{(\alpha)} \left(x + \frac{y}{m} \right). \end{aligned}$$

Then, from Theorem 5 we get

$$\begin{aligned} B_n^{(\alpha)}(x) &= \sum_{k=0}^n \frac{W_{m,r}(n, k)}{m^{n-k}} B_k^{(k+1+\alpha)} \left(x + 1 - \frac{r}{m} \right), \\ B_n^{(n+1+\alpha)}(x) &= \sum_{k=0}^n \frac{w_{m,r}(n, k)}{m^{n-k}} B_k^{(\alpha)} \left(x - 1 + \frac{r}{m} \right), \end{aligned}$$

and, since $\frac{d}{dx} B_n^{(\alpha)}(x) = n B_{n-1}^{(\alpha)}(x)$, if one differentiate the two sides of this last identity p times he obtain

$$B_n^{(n+p+1+\alpha)}(x) = \binom{n+p}{p}^{-1} \sum_{k=0}^n \binom{k+p}{p} \frac{w_{m,r}(n+p, k+p)}{m^{n-k}} B_k^{(\alpha)} \left(x - 1 + \frac{r}{m} \right).$$

Then, for $\alpha = 0$, there holds

$$B_n^{(n+p+1)}(x) = \binom{n+p}{p}^{-1} \sum_{k=0}^n \binom{k+p}{p} \frac{w_{m,r}(n+p, k+p)}{m^{n-k}} \left(x - 1 + \frac{r}{m} \right)^k$$

which gives for $x = 1 - \frac{r}{m}$:

$$B_n^{(n+p+1)} \left(1 - \frac{r}{m} \right) = \binom{n+p}{p}^{-1} \frac{w_{m,r}(n+p, p)}{m^n}.$$

Upon using this identity, identity (6) becomes when $\alpha = p$:

$$B_n^{(p)} \left(\frac{r-s}{m} \right) = \frac{1}{m^n} \sum_{k=0}^n \binom{k+p}{p}^{-1} W_{m,r}(n, k) w_{m,s}(k+p, p).$$

□

The high order Bernoulli polynomials of the second kind $(b_n^{(\alpha)}(x))$ can be defined by

$$\sum_{n \geq 0} b_n^{(\alpha)}(x) \frac{t^n}{n!} = \left(\frac{t}{\ln(1+t)} \right)^\alpha (1+t)^x$$

with $b_n^{(1)}(x) = b_n(x)$ is the n -th Bernoulli polynomial of the second kind, see [6, 16, 18, 20].

Corollary 8 *There hold*

$$b_n^{(\alpha)}(x) = \sum_{k=0}^n \frac{w_{m,r}(n, k)}{m^{n-k}} b_k^{(k+1+\alpha)} \left(x - 1 + \frac{r}{m} \right), \quad (8)$$

$$b_n^{(n+1+\alpha)}(x) = \sum_{k=0}^n \frac{W_{m,r}(n, k)}{m^{n-k}} b_k^{(\alpha)} \left(x + 1 - \frac{r}{m} \right) \quad (9)$$

and

$$\begin{aligned} b_n^{(n+p+1)} \left(1 + \frac{r}{m} \right) &= \frac{1}{m^n} \binom{n+p}{p}^{-1} W_{m,r}(n+p, p), \\ b_n^{(p)} \left(\frac{s-r}{m} \right) &= \frac{1}{m^n} \sum_{k=0}^n \binom{k+p}{p}^{-1} w_{m,r}(n, k) W_{m,s}(k+p, p). \end{aligned}$$

Proof. For $A(t) = \frac{1}{m} \ln(1+mt)$, $B(t) = (1+mt)^{-\frac{1}{m}}$ and $H(t) = 1$ we get

$$\begin{aligned} \overline{A}(t) &= \frac{1}{m} (e^{mt} - 1), \\ (B(\overline{A}(t)))^{-1} &= e^t, \\ B_{n+r, j+r}^{(r)}(\mathbf{a}; \mathbf{b}) &= w_{m,r}(n, k), \\ B_{n+r, k+r}^{(r)}(\overline{\mathbf{a}}; (\mathbf{b} \circ \overline{\mathbf{a}})^{-1}) &= W_{m,r}(n, k), \\ P_n^{(\alpha)}(x, y | A, B, 1) &= m^n b_n^{(\alpha)} \left(-x - \frac{y}{m} \right). \end{aligned}$$

Then, from Theorem 5 we get

$$\begin{aligned} b_n^{(\alpha)}(x) &= \sum_{k=0}^n \frac{w_{m,r}(n, k)}{m^{n-k}} b_k^{(k+1+\alpha)} \left(x - 1 + \frac{r}{m} \right), \\ b_n^{(n+1+\alpha)}(x) &= \sum_{k=0}^n \frac{W_{m,r}(n, k)}{m^{n-k}} b_k^{(\alpha)} \left(x + 1 - \frac{r}{m} \right), \end{aligned}$$

and, since $\frac{d}{dx} b_n^{(\alpha+1)}(x) = n b_{n-1}^{(\alpha)}(x)$, if one differentiate the two sides of this last identity p times he obtain

$$b_n^{(n+p+1+\alpha)}(x) = \binom{n+p}{p}^{-1} \sum_{k=0}^n \binom{k+p}{p} \frac{W_{m,r}(n+p, k+p)}{m^{n-k}} b_k^{(\alpha)} \left(x + 1 - \frac{r}{m} \right).$$

Then, for $\alpha = 0$, there holds

$$b_n^{(n+p+1)}(x) = \binom{n+p}{p}^{-1} \sum_{k=0}^n \binom{k+p}{p} \frac{W_{m,r}(n+p, k+p)}{m^{n-k}} \left(x + 1 - \frac{r}{m} \right)_k$$

which gives for $x = -1 + \frac{r}{m}$:

$$b_n^{(n+p+1)} \left(-1 + \frac{r}{m} \right) = \binom{n+p}{p}^{-1} \frac{W_{m,r}(n+p, p)}{m^n}.$$

Upon using this identity, identity (8) becomes when $\alpha = p$:

$$b_n^{(p)} \left(\frac{s-r}{m} \right) = \frac{1}{m^n} \sum_{k=0}^n \binom{k+p}{p}^{-1} w_{m,r}(n, k) W_{m,s}(k+p, p).$$

□

The above corollaries can be written in their general case as follows.

Proposition 9 *There holds*

$$D_{t=0}^n \left[\left(\frac{t}{A(t)} \right)^p (B(t))^{r-s} \right] = \frac{1}{p!} \sum_{k=0}^n \binom{k+p}{p}^{-1} B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) B_{k+p+s, p+s}^{(s)}(\bar{\mathbf{a}}; (\mathbf{b} \circ \bar{\mathbf{a}})^{-1}).$$

Proof. By definition and by Theorem 1, we have

$$\begin{aligned} D_{t=0}^n \left[\left(\frac{t}{A(t)} \right)^p (B(t))^{r-s} \right] &= P_n^{(p)}(0, r-s \mid A, B, 1) \\ &= \sum_{k=0}^n B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) P_k^{(k+p+1)}(1, -s \mid A, B, 1), \end{aligned}$$

and since

$$\begin{aligned} P_k^{(k+p+1)}(1, -s \mid A, B, 1) &= D_{t=0}^k \left(\frac{t}{A(t)} \right)^{k+p+1} A'(t) (B(t))^{-s} \\ &= D_{t=0}^k \left(\frac{\bar{A}(t)}{t} \right)^p (B \circ \bar{A}(t))^{-s} \\ &= \frac{1}{p!} \binom{k+p}{p}^{-1} B_{k+p+s, p+s}^{(s)}(\bar{\mathbf{a}}; (\mathbf{b} \circ \bar{\mathbf{a}})^{-1}), \end{aligned}$$

$$\text{it follows } P_n^{(p)}(0, r-s \mid A, B, 1) = \frac{1}{p!} \sum_{k=0}^n \binom{k+p}{p}^{-1} B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) B_{k+p+s, p+s}^{(s)}(\bar{\mathbf{a}}; (\mathbf{b} \circ \bar{\mathbf{a}})^{-1}). \quad \square$$

Similarly, we also have:

Proposition 10 *There holds*

$$D_{t=0}^n \left[\left(\frac{t}{A(t)} \right)^p (B(t))^r (A'(t))^{-s} \right] = \frac{1}{p!} \sum_{k=0}^n \binom{k+p}{p}^{-1} B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) B_{k+p+s, p+s}^{(s)}(\bar{\mathbf{a}}).$$

Proof. By definition and by Theorem 1, we have

$$\begin{aligned} D_{t=0}^n \left[\left(\frac{t}{A(t)} \right)^p (B(t))^r (A'(t))^{-s} \right] &= P_n^{(p)}(-s, r \mid A, B, 1) \\ &= \sum_{k=0}^n B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) P_k^{(k+p+1)}(1-s, 0 \mid A, B, 1), \end{aligned}$$

and since

$$\begin{aligned}
 P_k^{(k+p+1)}(1-s, 0 \mid A, B, 1) &= D_{t=0}^k \left(\frac{t}{A(t)} \right)^{k+p+1} (A'(t))^{1-s} \\
 &= D_{t=0}^k \left(\frac{\overline{A}(t)}{t} \right)^p (A' \circ \overline{A}(t))^{-s} \\
 &= D_{t=0}^k \left(\frac{\overline{A}(t)}{t} \right)^p (\overline{A}'(t))^s \\
 &= \frac{1}{p!} \binom{k+p}{p}^{-1} B_{k+p+s, p+s}^{(s)}(\overline{\mathbf{a}}),
 \end{aligned}$$

it follows $P_n^{(p)}(-s, r \mid A, B, 1) = \frac{1}{p!} \sum_{k=0}^n \binom{k+p}{p}^{-1} B_{n+r, k+r}^{(r)}(\mathbf{a}; \mathbf{b}) B_{k+p+s, p+s}^{(s)}(\overline{\mathbf{a}})$. \square
